(54) Title: SYSTEM AND METHOD FOR RETRIEVING DIGITAL MULTIMEDIA CONTENT FROM A NETWORK NODE

(57) Abstract: A scheme for retrieving digital multimedia content from a network node. A message is provided to the network node by a client application executing on a digital multimedia device, wherein the message includes a multidimensional pointer to a depository of digital multimedia content associated with the network node as well as a timing parameter operable to indicate when the message is to take effect. The multidimensional pointer contains a relative time offset variable as well as a plurality of media identifier dimensions corresponding to a plurality of nested hierarchical levels into which the digital multimedia content is organized. Responsive to the message, content from a particular content source identified by the multidimensional pointer is streamed to the digital multimedia device at a time indicated responsive to the timing parameter.
